Table e-3. Cox proportional hazards regression model for time to first continuous infusion.

	HR (95% confidence interval)	*p*-value
Awareness	1.08 (0.77-1.51)	0.6428
Intermittent SE	0.74 (0.51-1.09)	0.1300
Hospital onset	1.11 (0.77-1.59)	0.5713
SE onset during the day	0.98 (0.69-1.38)	0.8995
SE onset July-December	1.29 (0.91-1.82)	0.1594
White race	0.7 (0.48-1.03)	0.0689
Structural etiology	1.24 (0.83-1.85)	0.3029
Prior epilepsy	1.24 (0.84-1.83)	0.2888
Prior episode of SE	1.13 (0.71-1.77)	0.6112
Age in years	1 (0.97-1.03)	0.9199
Male	1.2 (0.85-1.68)	0.3040

This multivariable model shows that the hazard ratio of having received a first continuous infusion is higher for non-White race, but publication of evidence of delays had no effect on time to treatment.

Legend: CI: Confidence interval. **HR:** Hazard ratio. **SE:** Status epilepticus.
